Pills for medical abortion works best in the first 28 weeks of pregnancy. After that, there is an increased risk of a complication and need for medical attention. If you are considering using pills after 28 weeks, please contact us for instructions; these instructions are for women who are 28 weeks or earlier in their pregnancy. The pill causes contractions of the womb. As a consequence, the womb expels the pregnancy. A woman can get painful cramps, vaginal blood loss that is more than a normal menstruation, nausea, vomiting and diarrhea. There is a risk of heavy bleeding for which a woman will have to be treated by a doctor. The chance that an abortion with Misoprostol will be successful is 90%. the pill is available in pharmacies in almost all countries. The experience and risks of an abortion caused by Misoprostol are similar to those of a spontaneous miscarriage.Miscarriage happens spontaneously in 15-20% of all pregnancies.The treatment of complications is the same as those of a spontaneous abortion (miscarriage). If there is a problem, a woman can always go to the hospital or any doctor. The doctor will treat her as if she had a spontaneous miscarriage. There is no way the doctor will know that the woman took medicines.We will now provide some important information that every woman who thinks about inducing an abortion with medicines should know. A woman should make sure she is pregnant. safe10,000 Satisfied Clients Free deliveries for distant Customers +27784008613 A 50% DISCOUNT ABORTION CLINIC IN SOUTH AFRICA. -WHATSAPP - +27784008613 EARLY MEDICAL ABORTION Medical abortion, organic abortion is instrument free.
